- Browse the internet from your home country
- Encrypted and highly secure data transfer
- Integrates with your current environment
- Streaming services support
- Masquerading your internet traffic

YachtCloud ShoreVPN is a service that will route your internet traffic onboard through an other country. It will provide your yacht or connected device with an IP address that originates from another country.

Where normal VPN or proxy servers do not allow, or limit streaming services ShoreVPN is providing high throughput connectivity with full support for streaming.

By connecting via ShoreVPN you have the possibility to use the internet as if you are in the country, unlocking all of the services normally only available when in the country.

For example you could iTunes as if you where in the USA and make use streaming TV services that would normally only be available when at home.

An additional benefit is that your internet traffic is encrypted from your device to the datacenter and back, making it harder to track or intercept your traffic.

With ShoreVPN you are not tied to a certain client, we can incorporate many VPN clients, perhaps not additional software is needed to make us of the ShoreVPN service.
